

Design Championship Project Synopsis

Project Title: Seekho Sikhao — Indian Students Teaching Indian Students

Theme: Safe peer learning for school students

Project Type: Individual

Name: Maram Renu Reddy

Class: 9

School :Pragathi Central School

Hyderabad, Telangana

School students already teach each other ,a classmate who knows Python, a senior who wants to learn trigonometry, a cousin who does mehendi before annual day. That knowledge usually stays inside one friend circle or one campus club.

Paid tuition platforms treat the same need as a marketplace. They push one-to-one video calls with people the student does not know. For a school-age learner that is unlike how peer learning actually happens and difficult for a parent to supervise.

Seekho Sikhao addresses this gap. It is a group class board for Indian school students. Students register with parent consent, share short knowledge notes, and join or launch a skill batch. Google Meet stays locked until eight students have joined. There are no fees. When a batch ends, mentor and student both receive an e-certificate.

What Problem Does It Solve?

Students who want to teach or learn a skill after school have no safe, free, group-first place to do it.

Existing options fail in three ways:

- Private tuition apps and random video calls are one-to-one with strangers.
- School clubs exist, but they are tied to one campus and one timetable.
- Social media can spread a trick, but it does not form a class, keep a parent in the loop, or give a record when the work is finished.

Seekho Sikhao solves all three problems:

1. Group class, not a private chat — Meet opens only after eight names.
2. Parent consent on the same form — no join or launch without a guardian tick.
3. A finish line — dual e-certificates and an experiences page when the batch is marked done.

Students have skills to share, but no supervised batch in which to share them.

Target Users

- Student learner (Class 6–12) — needs a real class, not a chat with one stranger. Joins a batch. Meet unlocks after eight names.
- Student mentor (Class 8–12) — needs a way to teach without looking like a paid tutor. Launches a batch. Receives a mentor certificate when it closes.
- Parent / guardian — needs to know the call is a group and that consent was given. Ticks the box on the register form. May sit in Meet.
- Next batch of students — needs proof that a mentor finished a class. Reads experiences and printable certificates.

Primary user: a Class 9–11 student in an Indian city who already uses Google Meet for school.

Core Design Principle

Seekho Sikhao is built on the principle of a courtyard class, moved onto Google Meet. It offers peer teaching while leaving supervision and consent with a parent, and leaving the Meet link locked until the group is large enough to be a class.

The design focuses on:

- Group-first learning — never one-to-one private calls.
- Visitor actions stored only on this device — no company server, no paid account.
- Visible safety — locked Meet card, consent panel, house rules on the How page.
- Indian skill set as first-class content — tech, art, music, dance, languages, STEM, sports, life skills.

Proposed Solution

Seekho Sikhao is a client-side web application. Four product rules do the real design work:

- Minimum 8 students before Google Meet opens. Makes it a class, not a private tuition. The Meet code stays hidden until the count is reached.
- Parent / guardian consent on the same form. A diary-note home, not a terms-of-service wall. Without the tick, join and launch stay closed.
- No fees anywhere. Removes pressure and the fake premium-mentor path.
- Certificate for both sides when the mentor marks done. Teaching is work. Learning is work. Both get a paper.

A fifth loop sits on top of classes: the Knowledge wall. Short notes collect likes. Likes grow followers. At 100 followers a longer Blog unlocks. The blog is earned by teaching, not purchased as a badge.

Working Principle

Simple path through the site:

- 1.The student opens Home and reads the three rules: eight names, parent consent, no fees.
- 2.Register splits into a student block and a parent / guardian consent block. Without the tick, batches stay closed.
- 3.The student joins a forming batch or launches one. Until eight names are on the list, the Meet card only shows the count.
- 4.At eight students the Meet code appears. The same link is used every week. Parents may sit in.
- 5.Short notes go on the Knowledge wall. Likes grow followers. At 100 followers the Blog page opens.
- 6.When the mentor marks the batch done, mentor and every student receive an e-certificate that can be printed.

Special feature: Demo entry as Aditya or Ananya. A judge can open a full adda without typing a fake parent name. Reset demo clears this browser.

Everything runs in one HTML file in the browser. No React. No CMS. No website builder. No company login server.

Information Architecture

Sitemap

The site is a hash-router single page. Every screen is a function that returns HTML into #app.

Route	Page	Job
#/	Home	Promise, three doors, categories, live batches, sample certificate
#/batches	Batches board	Filter by status (forming / live / done) and subject
#/batch/:id	Batch detail	Mentor, roster, locked or live Meet, join / close
#/launch	Launch batch	Mentor form — title, skill, city, time, description
#/register	Register	Student block + parent consent. Demo as Ananya / Aditya
#/knowledge	Knowledge wall	Subject filter, notes, like, upload a note
#/blogs	Blogs	Longer notes. Write form appears only at 100 followers
#/experiences	Experiences	After-class voices from mentor and student
#/certificate/:id	E-certificate	Printable mentor or student copy
#/adda	My adda	Stats, batches, certificates, reset demo
#/people/:id	Profile	Bio, follow, their batches and notes

#/how and #/about	How / About	Steps, house rules, demo-character notice
-------------------	-------------	---

User Flow

Learner path: Home to Register (parent ticks consent) to Batches to join. Under eight students, Meet stays locked. At eight, status becomes Meet live and the code appears. After the last week the mentor marks the batch done. The student certificate appears in My adda.

Mentor path: Register to Knowledge wall to Launch a batch to wait until eight join to teach on the same Meet link to Mark batch done. Mentor certificate and a follower bump follow. At 100 followers, Blogs unlocks.

Parent path: Consent sits on the same screen as the student form. Copy states: group class, Google Meet, eight-student minimum, no fees. The batch page later states that parents may sit in.

Judge / demo path: Home to Register as Aditya to My adda to open a live batch and show the Meet code to open sample certificate to Knowledge wall to Reset demo.

Content Model

Hard-coded seed data paints the courtyard so the first open is not an empty board. Visitor actions are stored in local storage under the key seekho-html-v1.

- CATS / SKILLS / CITIES / CLASSES — taxonomy, seed in code
- PEOPLE — 12 written student characters, seed in code
- BATCHES — 9 batches in three states, seed plus user launches
- POSTS / BLOGS / EXPS / CERTS — wall, notebooks, voices, papers
- S.me, joined, liked, followed — visitor adda, runtime in this browser

Design Decisions

Visual system

Most education sites use purple gradients and stock photos of laptops. That does not match a courtyard class. Seekho Sikhao uses a warm paper ground, saffron for action, peacock green for navigation, and a thin tricolour bar. Type is split: serif titles, simple sans for buttons, Devanagari on the wordmark. The faint octagon tile in the background is a jaali.

Interaction

Sticky header with the same six links on every page. Status is a pill with words: Forming, Meet live, Completed. Cards lift on hover. On small screens the links go behind a menu button. Tap targets are at least 44px because the site will be used on a phone after school.

Safety as layout

The Meet block on a batch page has two designs. Under eight students it is a locked card that only counts. At eight it reveals the code and an Open Google Meet button. That visual

change is the product. Registration puts parent consent in a nested panel. How it works lists house rules: no fees, no UPI, no one-to-one, parents may sit in.

Voice

Copy is written like a student notice, not a brochure. Eight is the rule. A diary note for home. Print it for the cupboard. Character bios stay specific (kolam with a grandmother, tabla on a terrace). Profiles on the board are written characters, and the About page states so.

. Accessibility

Keyboard users get a visible outline on buttons and links. Controls are at least 44px tall for phone use. Status pills say Forming, Meet live or Completed in words, not only in colour. Avatars carry a name, and the certificate page hides extra buttons when printing.

UI Concepts

- Background: warm paper
- Action colour: saffron; trust / links: peacock green
- Type: serif titles, sans interface, Devanagari wordmark
- Cards: rounded, light shadow, lift on hover
- Avatars: SVG motifs from a colour hue — no photographs of real students
- Certificate: full print page with a number, not a popup message

Design Iterations

Version	Attempt	Outcome
Sketch 1	Marketplace of 1:1 tutors with prices	Dropped. Unsafe and against the idea.
Sketch 2	Open chat room by subject	Dropped. No batch, no parent, no end.
Sketch 3	School club pages with long forms	Too heavy. Students would bounce.
Build 1	Separate HTML files per page	Dropped. One-file hash pages are easier to submit.
Build 2	Meet link always visible	Changed. Link now locked until 8.
Build 3	Followers only from a Follow button	Added likes-on-notes so teaching on the wall also counts.
Build 4	Certificate as a popup	Changed to a full printable page with a number.
Polish	Purple ed-tech palette	Replaced with paper, saffron, peacock.

Early notebook wireframes covered four screens: home with three doors (Batches, Launch, Register); a batch card with Meet locked and the same card with the code visible; a register

form split into student half and parent half; a certificate laid out like a school prize paper. The built site follows those four pages.

Technical Approach

Stack: one HTML file, CSS in a style block, behaviour in a script block. No React, no build step, no CMS. Hosting is optional because the app is static.

Limits of the prototype

There is no real school login server. Meet codes in the demo are sample codes. Parent phone numbers stay in this browser only. Board profiles are written characters, and the About page says so. A school club version would paste a teacher-made Meet link.

Architecture

- Seed data — categories, people, batches, posts at the top of the file.
- State S — the visitor. Loaded from localStorage or an empty adda.
- Helpers — save, toast, esc (stops HTML injection in names and notes), person, avatar, liveBatches.
- Page functions — each route returns an HTML string.
- window actions — joinBatch, completeBatch, likePost, follow, registerMe, launch, addPost.
- render() — reads location.hash, paints nav, writes innerHTML of #app.

Key function: liveBatches()

Seed batches and user-launched batches are merged. Joins from this browser are added to the student list if there is room and the visitor is not already the mentor. Status is then recomputed: if marked complete, it is completed; else if seats are 8 or more, it is running. Every card on Home and Batches reads this live list, so the board updates without a server.

Implementation notes

- esc() encodes special characters before any user text is dropped into HTML.
- trySample fills a legal demo adda so a review is not forced to type a fake parent name.
- completeBatch refuses if seats are under 8 or the visitor is not the mentor, then writes a mentor certificate and adds 15 followers.
- addPost adds 4 followers so 100 is reachable in a demo without being free.
- Avatars are inline SVG motifs hashed from a hue. No stock photos.
- Fonts: Fraunces, Nunito Sans, Tiro Devanagari Hindi (Open Font License). Offline fallback: Georgia / Segoe UI.

External Assets and Attribution

- Google Fonts — Fraunces, Nunito Sans, Tiro Devanagari Hindi. Open Font License.

- Google Meet — outbound class buttons only. Sample codes in the demo.
- Inline SVG logo and avatars — drawn in code for this project.
- No stock photos, no icon pack, no CSS framework, no CMS theme.

AI Usage Disclosure

The championship allows AI tools for research, UI suggestions, debugging help and documentation. Seekho Sikhao was not generated as a finished website and pasted.

Student-owned core: the four safety rules, the page map, the data shapes, the routing design, the seed world (people, batches, posts), and the visual system.

AI (Grok, xAI) : used as a helper: to bounce wording, check a hash-routing bug, run an accessibility checklist, and pack documentation. Every draft was lined up against the actual HTML before it stayed in the file.

ChatGPT: Assisted with raw array structure templates and layout algorithms, which I modified to focus entirely on Indian cities and cultural skill domains.

Claude: Provided responsive media query CSS configurations, which I consolidated straight into the main index.html file to create a 100% serverless, single-file application

GitHub Copilot: Suggested structural code layouts for the join interaction functions, which I completely rewrote using precise template backticks (`) to fix a literal text display rendering bug.

Not used: one-prompt auto-building of the whole site; a website builder; a CMS theme.

How the Project Meets Judging Criteria

Design thinking and problem solving. Group-first model vs tuition apps. Parent consent as a screen, not a PDF. Meet lock as the mechanic that enforces the idea.

UI and UX. Paper courtyard visual system. Sticky nav. Status pills. 44px targets. Certificate print view. Demo-login so a judge is not blocked by a form.

Technical quality. Working SPA: register, join, launch, like, follow, close batch, persist in localStorage, escape user text, responsive nav.

Innovation and uniqueness. Eight-before-Meet. Dual certificates. Follower-gated blog. Indian skill set as first-class categories.

Presentation and understanding. This document, the 60-second video, and a walkthrough of liveBatches() and the Meet lock.

Project Demonstration Notes

Website purpose. A group class board for Indian school students. Teach a batch or join a batch. Not one-to-one.

Key features. Parent consent, 8-before-Meet, knowledge wall, 100-follower blog, dual e-certificate, demo adda.

User journey. Sneha joining Compound cricket, or a new mentor launching a Python batch and waiting for eight.

Design decisions. Paper, saffron and peacock so the site feels like a school magazine. Locked Meet card so the rule is visible.

Code structure. Seed data at the top, state S in localStorage, page functions, render() on hashchange.

AI usage. Grok tightened copy and this document. The rules and the batch logic were student decisions.

Challenges. Merging seed batches with joined lists without double-counting the mentor. Keeping Meet hidden until eight.

Skills developed. Information architecture, client-side state, accessible UI, interface copy, knowing when a prototype should stop claiming things.

Development workflow. Paper sitemap to colour tokens to seed world to router to actions to CSS polish to documentation.

Conclusion

Seekho Sikhao responds to a clear gap — students have skills, but no supervised batch — with a practical web application: parent consent, eight names before Meet, a knowledge wall, a blog earned at 100 followers, and an e-certificate for both sides.

Built as one original HTML file, designed for an Indian school courtyard rather than an app-store landing page, and free for the student, it fills a space that tuition marketplaces and empty social feeds ignore.

The prototype is honest about its limits (sample Meet codes, browser-only storage, written characters on the board) and complete about its rules. Those rules are the project.
